

# Data Structure : INTRODUCTION

What?

Data

+

Structure

Organization of data items in such a way that it is easy to -

**Access, Manipulate & Update**

Why?

Data become **more manageable** if we use right data structure for a problem

It will be **easy to find solution** of a problem if correct data structure has been used

# Data Structure : INTRODUCTION

One example of data structure is table – (Matrix/ 2D Array)

101

102

103

Table 1

Roll Number	Name
101	Anu
102	Radha
103	Ram

Anu

Radha

Ram

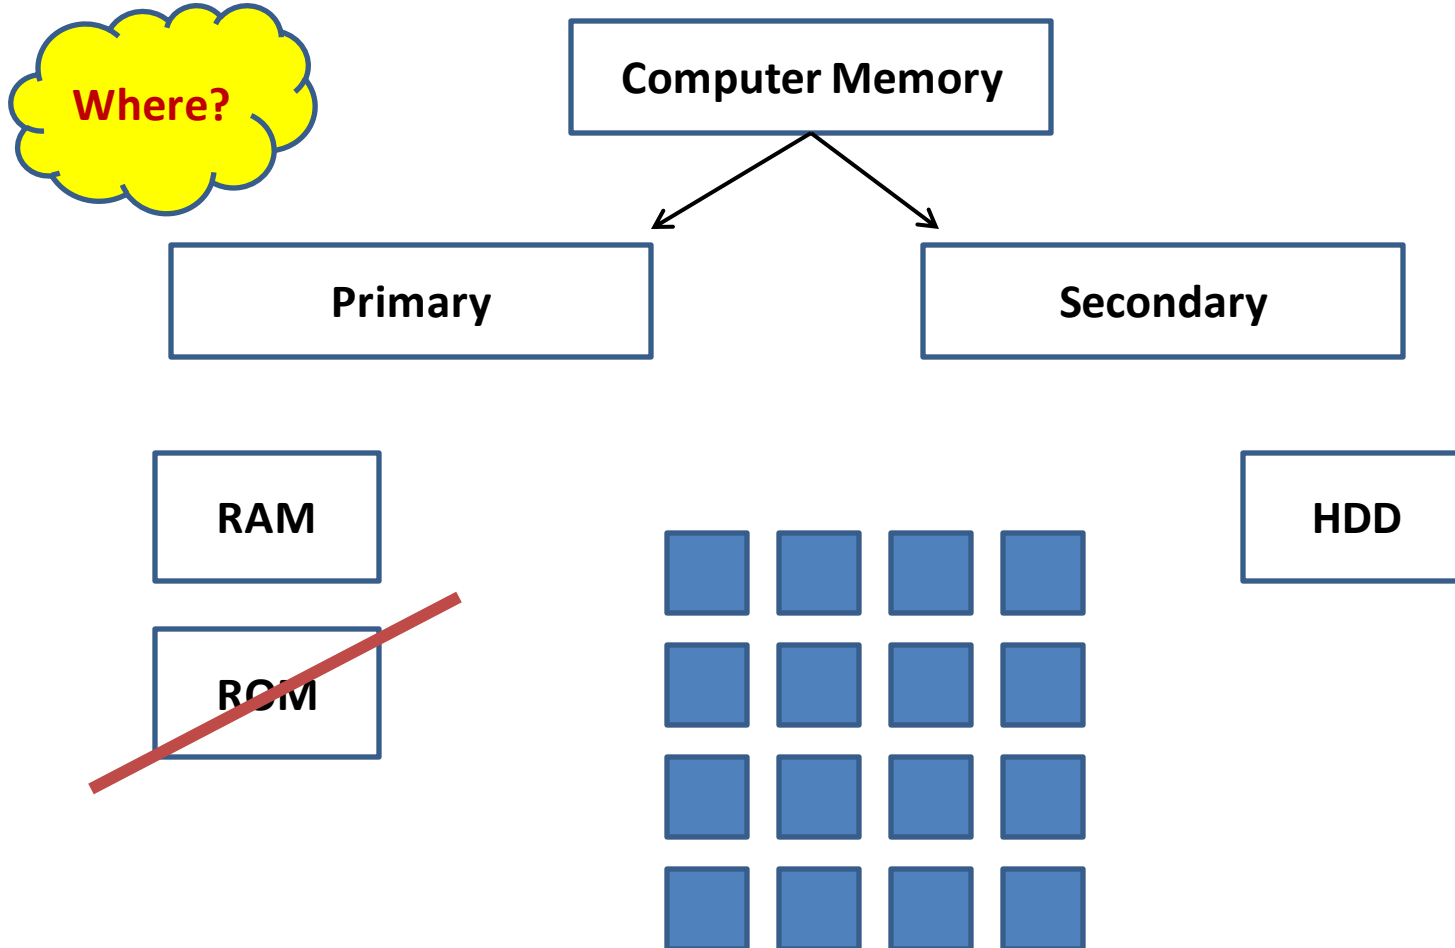

**Where** a Data Structure is going to be stored in my computer's memory?

**When** Data Structure is going to be stored ?

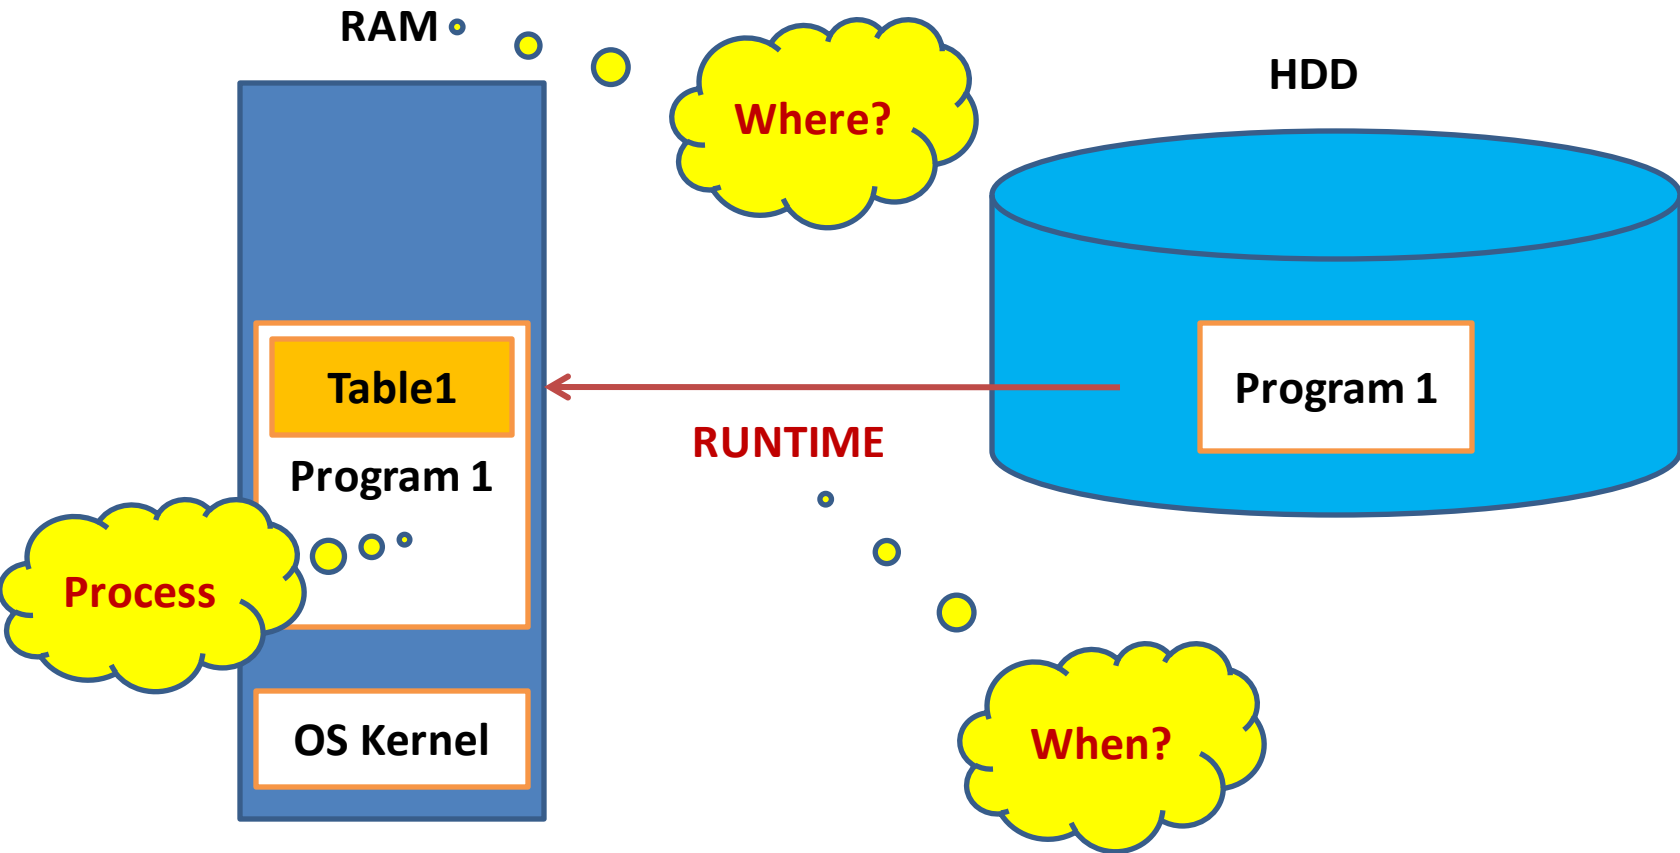

**How** Data Structure is going to be stored ?

# Data Structure : INTRODUCTION

Where a Data Structure is going to be stored in my computer's memory?

# Data Structure : INTRODUCTION

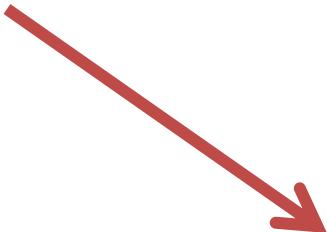

# Data Structure : INTRODUCTION

1	2		
A	V		
11	XX		
R	111		

Roll Number	Name
101	Anu
102	Radha
103	Ram

Linear Arrangement of Data

1	2	101	Anu
A	V	102	Radha
11	XX	103	Ram
R	111		

# Data Structure : INTRODUCTION

Roll Number	Name
101	Anu
102	Radha
103	Ram

Discrete Arrangement of Data

**Data Structure is a conceptual programming construct**

**These are run time entities**

**You can not save a data structure in HDD for future use**

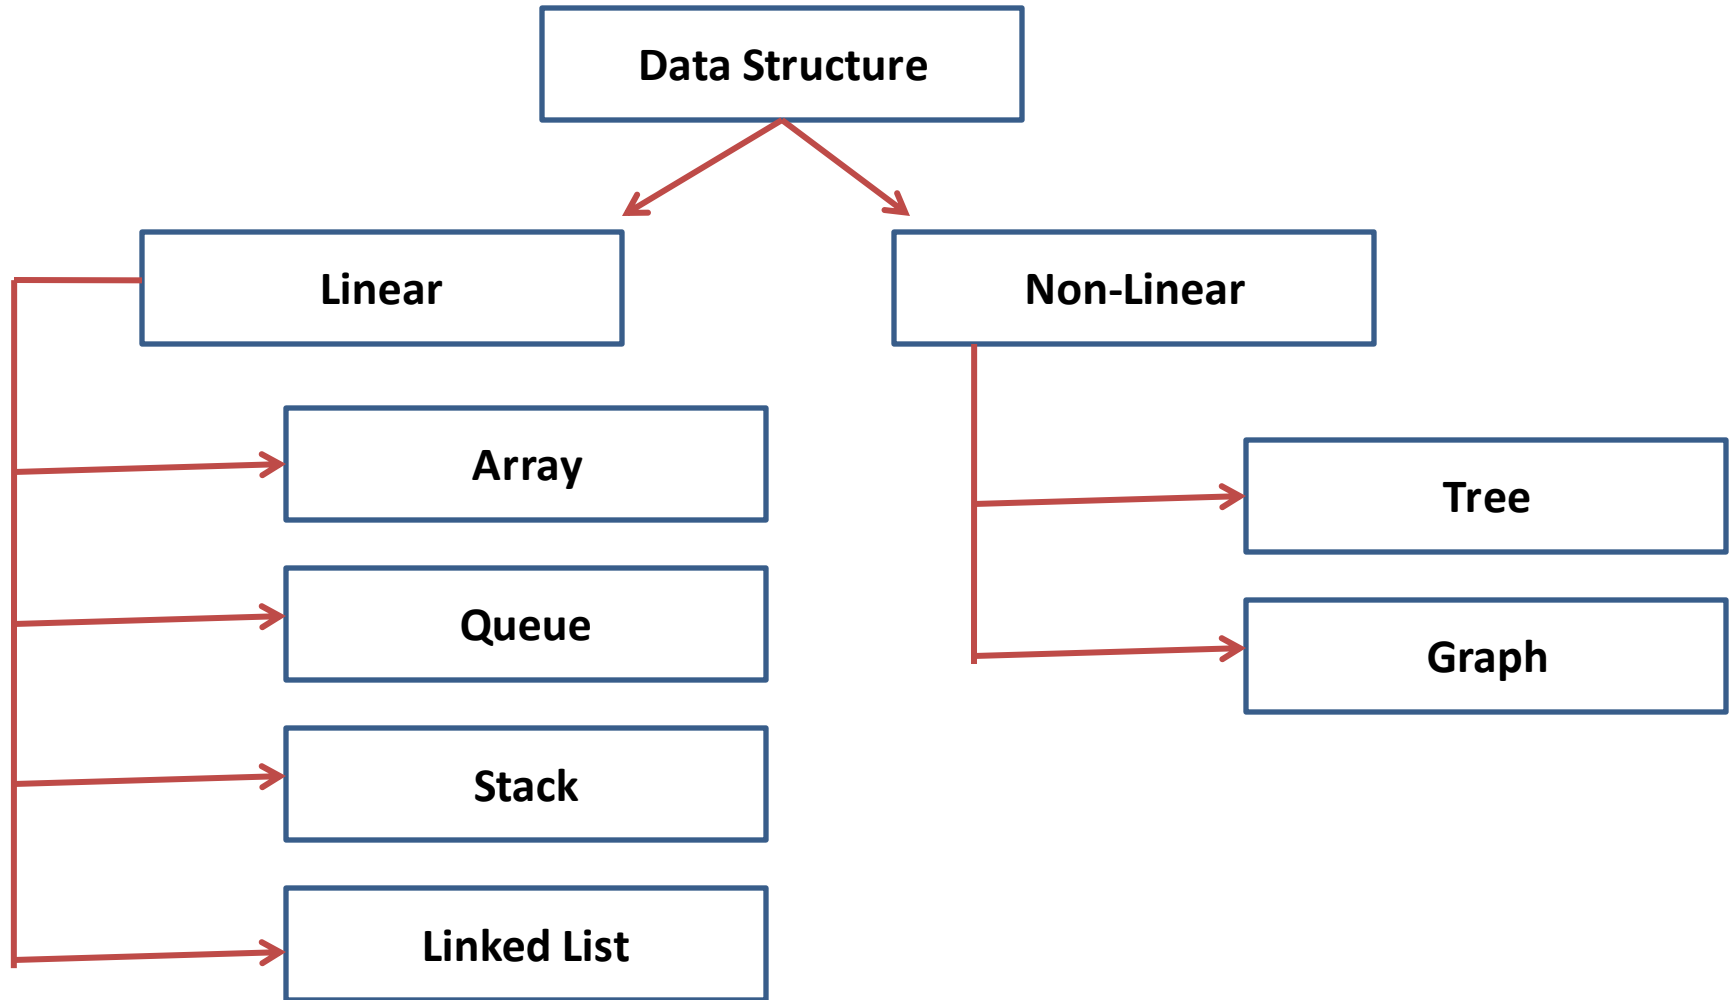

**Data Structure is a conceptual programming construct**

**These are run time entities**

**You can not save a data structure in HDD for future use**

# Data Structure : TYPES

# Data Structure : ALGORITHMS

The process of implementation of a solution of a complex problem

using Data Structure is Complex and very lengthy

It is important to plan the steps of such problems before implementing solutions

And

To solve such problem in modular way

modular way means to break a complex problem in smaller problem (modules)

Advantage:

This can be done using **ALGORITHMS**

- Easy to **Plan**
- Easy to **implement**
- Easy to **understand**
- Easy to **debug** (find errors)
- Easy to **Test**

# Data Structure : ALGORITHMS

What?

Algorithm

A set of **Step by Step Instructions** that provide a solution to a problem

“a **finite** sequence of well-defined, computer-implementable instructions”  
- Wiki

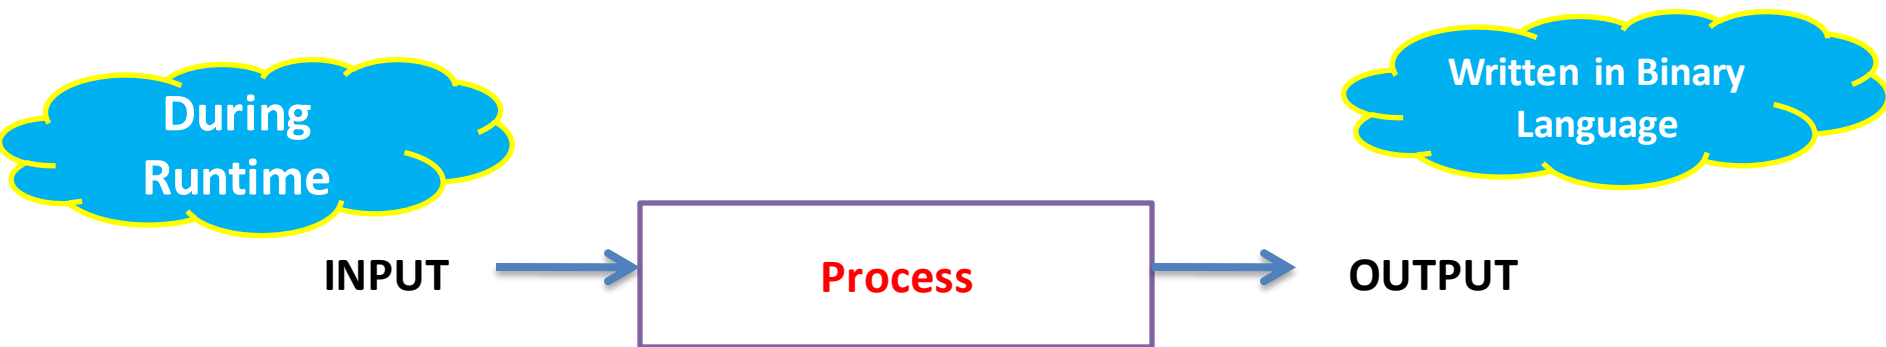

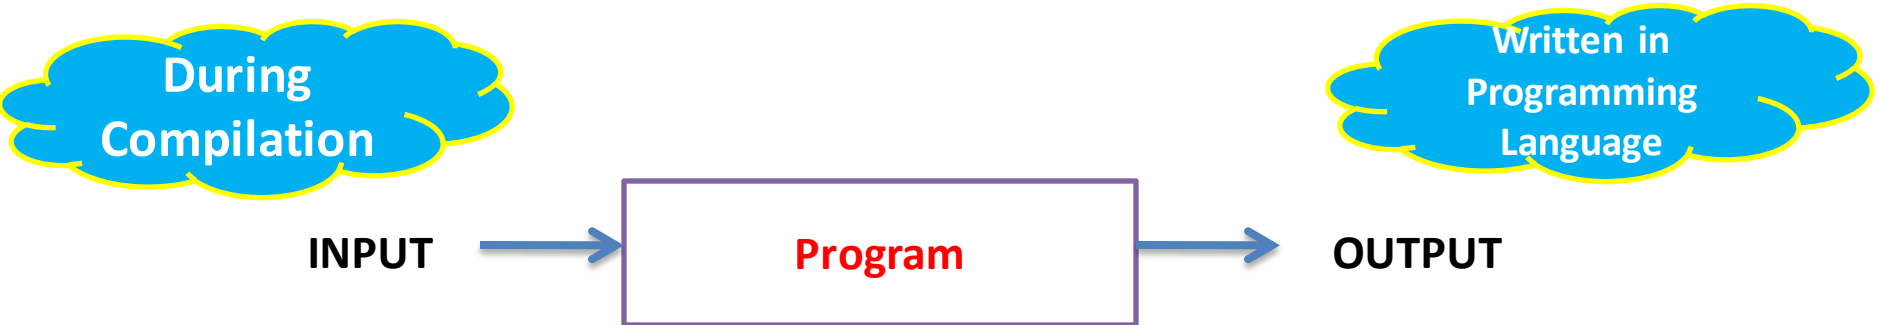

“An algorithm is any well-defined computational procedure that takes some value, or set of values, as input and produces some value, or set of values, as output”

-Coreman

# Data Structure : ALGORITHMS

Question : This is a program/process also do. Then What is the Difference?

# Data Structure : ALGORITHMS

**Algorithm**

can be written in

in a general language that is **easily understandable**  
Natural Language like English

It is a convention to use **Pseudo code** or **Flow Charts** etc.

**Symbolic Instruction**

**Diagrammatic Representation**

**Thanks**
